

Third Party Api's

Team ID	NM2023TMID04387
Project Name	Project – Ethereum Decentralised Smart Contract

Ethereum blockchain API:

The most popular Ethereum API is Alchemy Supernode. All the functionality of a node is available, including JSON RPC support. However, you get the supercharged reliability and data correctness required to run top-level applications on the blockchain.

A Third Party In Blockchain:

Blockchain eliminates the need for third-party verification—and, with it, their associated costs.

API In Ethereum:

Reading Blockchain Data

Ethereum API enables developers to retrieve essential blockchain data, such as account balances, transaction history, and contract states. This information is crucial for building applications that require real-time access to up-to-date data from the Ethereum blockchain.
